QA Bug Report

#	Title / Summary	Steps to Reproduce	Expected vs Actual	Severity	Suspected Cause
---	-----------------	--------------------	--------------------	----------	-----------------

---	---	---	---	---	---
-----	-----	-----	-----	-----	-----

1	Invalid email format validation is weak	Enter `abc` in email field and click Sign In	Expected: clear email validation message. Actual: validation feedback is unclear.	Medium	Incomplete frontend validation handling
---	---	--	---	--------	---

2	Login button allows repeated submissions	Rapidly click Sign In button multiple times	Expected: button disabled during request processing. Actual: multiple submissions possible.	Medium	Missing loading-state protection
---	--	---	---	--------	----------------------------------

3	Long input values affect UI layout	Paste extremely long text into email field	Expected: responsive input handling. Actual: layout overflow and UI distortion observed.	Low	Missing responsive input constraints
---	------------------------------------	--	--	-----	--------------------------------------

4	Required field visibility is not prominent	Submit form with empty fields	Expected: strong required field indicators. Actual: validation visibility is weak.	Medium	Weak form validation styling
---	--	-------------------------------	--	--------	------------------------------

5	Mobile responsiveness issues on smaller screens	Open developer tools and switch to mobile view	Expected: stable responsive layout. Actual: spacing/alignment inconsistencies visible.	Low	Incomplete responsive CSS optimization
---	---	--	--	-----	--

6	Error messaging lacks actionable guidance	Attempt login using invalid credentials	Expected: user-friendly explanation. Actual: generic login failure message displayed.	Medium	Backend error response exposed directly
---	---	---	---	--------	---

7	No protection against brute-force login attempts	Repeatedly attempt invalid logins rapidly	Expected: rate limiting or temporary lockout. Actual: unlimited attempts allowed.	High	Missing authentication rate limiting
---	--	---	---	------	--------------------------------------

Root Cause Analysis

Login button allows repeated submissions

The application currently allows users to click the Sign In button multiple times while the login request is still processing. This can create duplicate authentication requests and unnecessary backend traffic.

The root cause appears to be missing frontend loading-state management. The button remains active during asynchronous API execution instead of being temporarily disabled.

This issue can negatively impact both user experience and backend performance. Multiple simultaneous requests may also lead to inconsistent authentication behavior under heavy traffic conditions.

To fix this issue properly:

- Disable the Sign In button immediately after submission
- Show loading spinner or progress indicator
- Prevent duplicate API requests until response completes
- Add debounce or request-locking mechanism
- Improve frontend request-state management

This issue should be addressed before production deployment to improve stability, usability, and backend efficiency.
